

Mandrel Segments

Designed for slitting line coilers and decoilers as a replacement for steel segments, our Mandrel Segments have been supplied to steel mills around the world.

Manufactured from our proprietary Westlon material, a type of nylon specially engineered to optimise its strength and resilience, our Mandrel Segments are available as standard make up segments or as a castellated split-tube that can be tailored to fit any type of expanding mandrel.

Much lighter than its metal alternative, typically our Mandrel Segments can be changed in under one hour, meaning reduced downtime and increased productivity.

Key Benefits

- Lightweight making it easier and safer to use
- Long lasting - can be expected to last many years
- Multi-linked segments require no fixings
- Improved productivity through reduced coil change time
- Reduced coil scrap with castellated segments
